

SLA Compliance Plugin

1. Purpose

Add a Redmine plugin that lets us define SLA policies per customer project and automatically measure SLA compliance for Incident tickets within a selected date range, presented as a visual dashboard.

2. Scope

- Works across multiple Redmine **Projects** (each project = one customer)
- Each project can have its **own SLA targets** (since SLA terms differ per customer).
- Parent projects **SLA** should inherit to its own Child projects
- All the configuration pages, dashboard page should be visible for selected User roles only. It should be configurable who can view/edit
 - By default only Admins
 - Admin can configure who else other user roles can see these pages

3. Terminology Mapping

Plugin must use the Redmine **Priority** field as the Severity indicator. No new custom field

Priority → SLA Severity mapping for sample customer

Redmine Priority (Incident tracker)	Maps to SLA Severity	Notes
L1 - Catastrophic	Severity 1 (Catastrophic)	
L2 - Urgent	Severity 2 (Urgent)	
L3 - Non-Blocker	Severity 3 (Serious)	

None

Unclassified

Excluded from SLA compliance calculation;
flagged for triage so it can be reclassified

Status Mapping

Available Statuses in Incident tickets in sample customer:

- New, In progress, Waiting on Client, Waiting on Entgra, On Hold, Closed, Re-opened

- Ticket created: New, Re-opened
- Ticket work in progress: In progress, Waiting on Entgra
- Resolved - Waiting on Client, Closed

4. Functional Requirements

4.1 Define SLA Policy (per project)

Admin-only screen, accessible from Project Settings → "SLA Policy" tab to define SLA policy for that project.

Define the areas that are required to get details for the SLA Compliance dashboard.

If a SLA policy is defined for a parent project, same should be inherited for the child projects.

a) Enable SLA

Field	Type	Description
SLA Enabled	Checkbox	Turns SLA tracking on/off for this project. When off, the project is excluded entirely from the SLA Compliance dashboard.
Coverage Hours	Dropdown	24x7x365 or Business Hours. Determines how elapsed time is calculated (calendar time vs. working time).

Business Calendar	Dropdown	Active only when Coverage Hours = Business Hours. Defines working days, hours, and holidays used for time calculations.
-------------------	----------	---

b) SLA Measurement Rules

Defines which Redmine statuses/events represent each SLA milestone. If a field is left empty, that milestone is not evaluated for this project.

Field	Type	Description
Ticket Created Statuses	Multi-select	Statuses that count as the ticket's "start" (e.g., New, Re-opened). SLA clock starts from the time the ticket entered one of these statuses.
Work Started Statuses	Multi-select	Statuses considered "work in progress" (e.g., In Progress, Waiting on Entgra).
Resolved Statuses	Multi-select	Statuses considered "resolved" for SLA purposes (e.g., Waiting on Client, Closed).
First Response Event	Radio (First Comment / Status Change / Either)	Determines what counts as the "response" — the first comment added, the first status change, or whichever happens first.
Resolution Event	Derived	Always triggered when the issue status changes to one of the configured Resolved Statuses.
At-Risk Threshold		Defines how early to flag a ticket as "at risk" before it breaches. Configurable per project.

c) SLA Definitions (per Tracker & Priority)

- Admin selects the **Tracker**.
- The system reads the **Priority** options configured on that tracker for the project and lists them to configure SLA times.
- For each Priority, admin sets:

Target	Selectable options
Response Time	1 Hour, 4 Hour, 6 Hour, 1 Business Day
Workaround Time	24 Hours, 48 Hours, 72 Hours
Resolution Time	48 Hours, 72 Hours, 1 Business Week, Best Effort
• Any target left unset is skipped during compliance evaluation for that priority — no breach/met status is calculated for it. • A Priority value of "None" (unclassified) is always excluded from SLA evaluation and shown separately on the dashboard as unclassified/needs-triage.	

d) Exclusions (SLA Clock Pauses)

Field	Type	Description
Pause SLA on Waiting on Client	Checkbox	When enabled, time spent in the "Waiting on Client" status does not count toward Response/Workaround/Resolution time.

Additional rules

- A policy can be **cloned** from another project's policy as a starting point, then edited.

- Saving a policy does **not** retroactively recalculate already-closed tickets; it applies to compliance calculations going forward.
If want to calculate changing SLA setting for old issues, provide a additional 'tick' before saving to ask if the user wants to recalculate SLA compliance based on the changes made.
- Only Admins/Managers of projects can view or edit this configuration screen.

Allow cloning Policy from another project, since most customers has similar terms

d) Few UI suggestions

a) Enable SLA

☒ SLA tracking enabled for this project

Coverage hours

Business calendar (if Business Hours)

24x7x365

— Select calendar —

b) SLA Measurement Rules

Leave a status field empty to skip that part of SLA evaluation.

Ticket created statuses

New ×

Re-opened ×

+ Add status

Work started statuses

In Progress ×

Waiting on Entgra ×

+ Add status

Resolved statuses

Waiting on Client ×

Closed ×

+ Add status

First response event

First comment

Fixed rule — response time is measured to the first comment added on the ticket.

Resolution event

Status changed to Resolved status

Fixed rule — derived from the "Resolved statuses" list above.

c) SLA Definitions

Priorities are added one at a time. The dropdown lists only priority values configured on this project's selected tracker — these vary by customer/project.

Tracker

Incidents

L1 - Catastrophic

Remove X

Response time

1 Hour

Workaround time

24 Hours

Resolution time

48 Hours

L2 - Urgent

Remove X

Response time

6 Hour

Workaround time

48 Hours

Resolution time

72 Hours

L3 - Non-Blocker

Remove X

Response time

— Not set —

Workaround time

72 Hours

Resolution time

1 Business Week

— Select priority to add —

+ Add

Showing remaining priorities available on this project's "Incidents" tracker. Priorities not added here are treated as Unclassified and excluded from SLA evaluation.

d) Exclusions (SLA Clock Pauses)

Time spent in any status added here does not count toward Response, Workaround, or Resolution time.

Pause SLA clock on statuses

Waiting on Client X

Waiting on Third Party X

+ Add status...

Leave empty if no statuses should pause the SLA clock for this project.

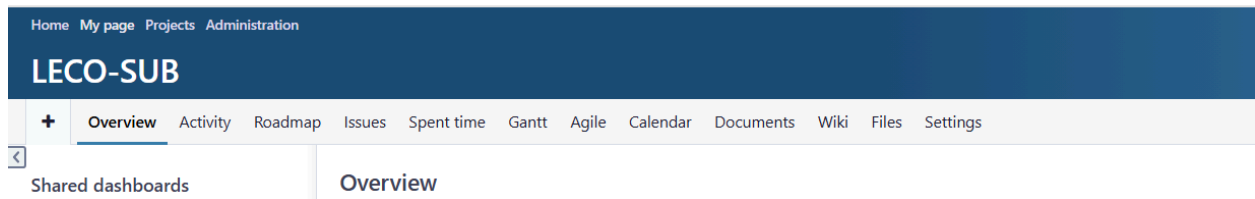

4.2 SLA Compliance Dashboard

Design the SLA Compliance Dashboard with proper visualizations(Summary cards, graphs, charts , table or what ever best way)

Top Level:

Project Level: LECO-SUB

a) Filters

Field	Type	Description
Project	Single/multi-select	Defaults to all projects the user has access to where SLA is enabled. Projects with SLA disabled are excluded from the list. If in a Project, select that project by default. If no sub-projects, do not allow to change If in a top level, allow selecting multiple projects in the sub level
Date Range	Date picker with presets	Filters by ticket created date. Presets: This week, Last week, This Month, Last Month, Last 3 Months, Custom Range.

Tracker	Multi-select	Show only the SLA configured tracker types in the selected project(s)
Severity/Priority	Multi-select	Filter results to specific priority levels. Allow selecting the selected Tracker's priority levels

Project ▾

Date range ▾

Tracker ▾

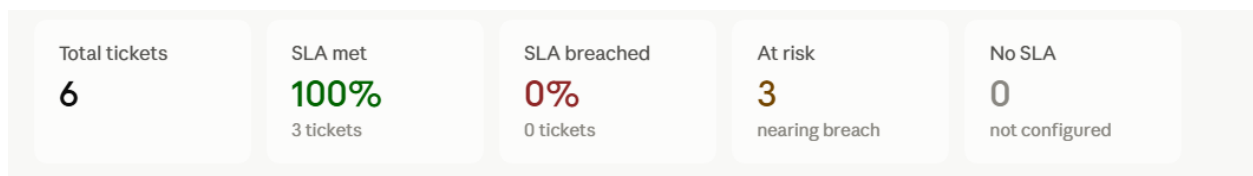

Priority ▾

× Clear filters

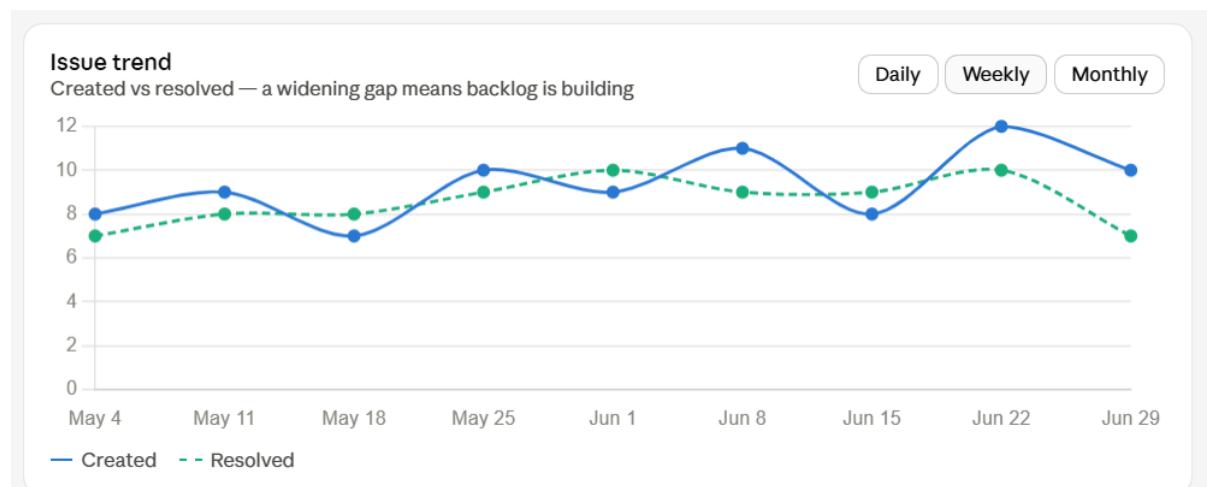

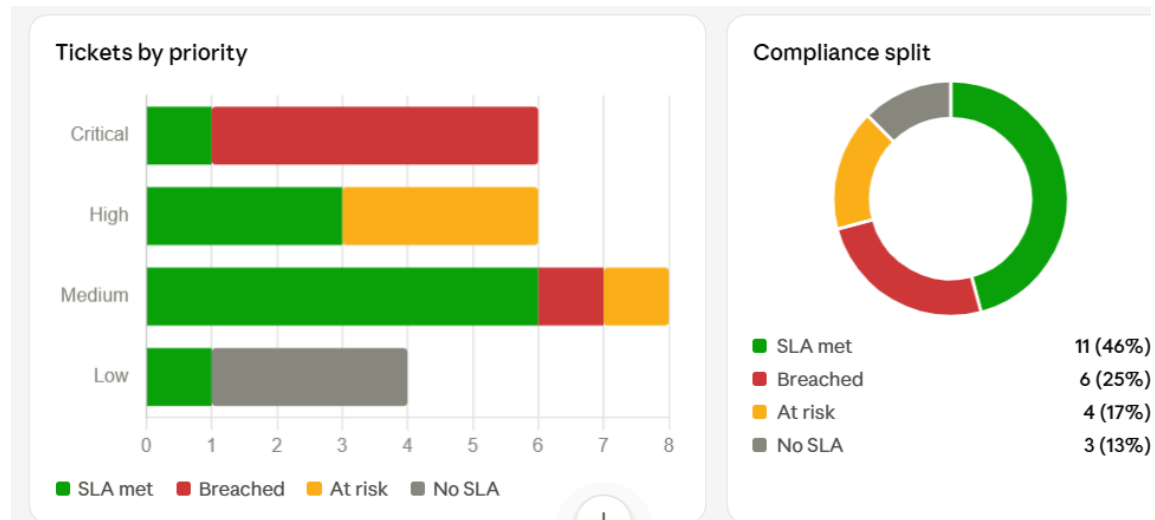

- Once values are selected from these filters, better to show what is selected easily in the dashboard
- Keep this top filter section visible always (freezed) when scrolling down for each access

What data to show in the SLA dashboard:

- Counts
 - Total tickets,
 - % SLA met tickets count
 - % SLA breached tickets count (tickets that already SLA breached)
 - Ticket at risk to breach SLA (tickets that will soon come to breach state)
 - No SLA
 - SLA not configured
 - Issues not tracked with configure SLA
 - Ultimately Total ticket count should equal to
 - SLA met + SLA breached + No SLA

- Visualize
 - Compliance split in a pie/donut chat (SLA met, Breached, No SLA)
 - Horizontal bar chart to show tickets by priority.
 - Issue trend graph - created vs resolved trend graph
 - Resolved - should be taken from the configuration. IN configuration we define what 'issue resolution' means

Above UIs are suggestions only. Use priorities values from the Redmine defined values, **do not hardcode any**.

Make sure to use common legends and utilize space effectively

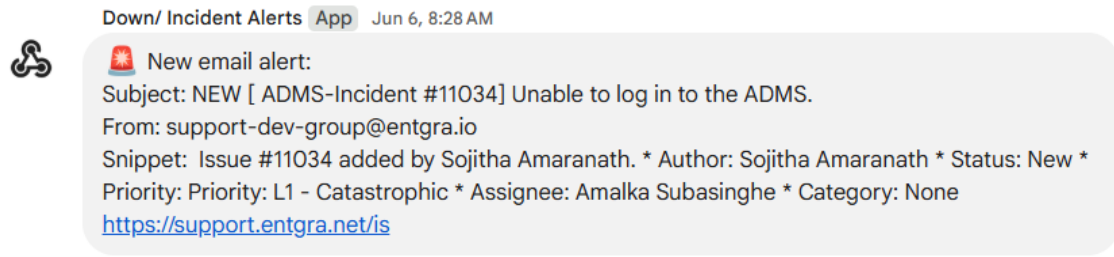

Do not duplicate the text in the dashboard.

- Table with tickets in the selected period with all default details. (project, Tracker type ticket, title, status, Assignee, etc - check what other details important)
 - Allow sorting.
 - Show either SLA met, SLA breached, At risk, No SLA status for each ticket
 - First response given time for each ticket
 - resolution time for each ticket
 - Deviated time - for SLA breached issues (time of time went over compared to target times)

Tickets should be clickable and open the ticket in a new tab

5. Send Message to the Google Spaces[Chat] when an issue is Created

- When a new issue is created we need to send a notification to a google space.
- Check how to automatically trigger notifications when an issue is created based on the configured SLA. This notification only should be SLA configured trackr
- Sample notification format in the current chat

Issue Notification — **ADMS**

A new issue has been submitted and requires your attention.

Reference: #142

Title: Login page throws 500 on Safari

Type: Bug

Priority: High

Submitted By: Sahad Rushdi

Assigned To: Charitha

Due Date: July 15, 2026

Please review and take appropriate action.

6. Notifications

Send Email Notification for SLA At-Risk Tickets

When a ticket is approaching its SLA breach point (Response, Workaround, or Resolution — as configured in Section 4.1), the plugin should send an email notification to a pre-defined email group so the team can act before the breach occurs.

Enable Email Notification -

- Turns this notification on/off for the project.
- Recipient Group - Defined email distribution group(s) to notify). Configurable per project

- Notification Frequency - Real-time: send immediately when a ticket crosses the at-risk threshold. Digest: batch all at-risk tickets into a single email sent at a configured interval (e.g., every 1 hour). This should be configurable
- Notification format
 - Decide on a better format

Email Notification for stale tickets

For tickets excluded from SLA evaluation (Priority = "None"/Unclassified, or SLA target left unset per), the plugin should track how long they've gone without activity and email a weekly digest so they don't get forgotten simply because they aren't tracked against an SLA clock.

- notify to a configured email address
- Notification frequency - should be configurable
- What details to include
 - Tickets title, status, created, last updated, assignee, project, and check any other important information

7. Non-Functional Requirements

- Should not break existing Redmine workflows or trackers
- Should not introduce delays in existing Redmine workflows
